IN THE SPECIFICATION:

Please amend the paragraph beginning on page 14, line 29 as follows:

Referring again to block **416**, if a determination is made that the unique identifier which identifies this packet's session was found in the listing, ~~the process passes to block 422 which illustrates~~ the router ~~retrieving~~ <u>retrieves</u> the time (t) stored in the listing with the unique identifier which identifies this packet's session. Next, block [[424]] <u>**422**</u> depicts the router calculating a transmission time. The transmission time is the time stored with this listing plus the estimated round trip time for a packet. Next, block [[426]] <u>**424**</u> depicts a determination of whether or not the current time is greater than the transmission time. If a determination is made that the current time is greater than the transmission time, the process passes back to block **410**. Referring again to block [[426]] <u>**424**</u>, if a determination is made that the current time is not greater than the transmission time, the process passes to block **420**.
